

INTERNAL OPERATING REFERENCE

P U L S E

Internal User Guide

Screen-by-screen guidance for using PULSE in day-to-day project and operational work.

USE THIS GUIDE TO	DOCUMENT STATUS
Find a module, understand the screen, and complete the next action with the correct record and role.	Internal reference. Screenshots show locally captured routes; live SharePoint permissions and persistence still require site verification.

ONE SHARED VIEW. CLEAR ACTION.

How to use this reference

This guide follows the current PULSE navigation and then moves into the tools inside a project workspace. Use the screen name, navigation path, and role notes to locate the right record before making a change.

01 Start a session Access, identity, Dashboard, and notifications	02 Overview Personal work, portfolio context, workload, resources, and operations
03 Projects Projects, portfolios, programs, end-item configurations, and creation	04 Project workspace Home, People, Documents, Tracker, Gantt, Boards, Reporting, Meeting, Notes, Tickets, Settings
05 Weekly Meeting Shared cadence, attendance, notes, decisions, Rocks, and history	06 Travel Requests, approvals, finance, calendar, and debriefs
07 Document Review Formal review, revision, concurrence, final pack, and signing	08 Support and notifications Tickets, notification settings, and operational follow-up
09 Administration Setup, users, roles, locations, diagnostics, and activity logs	10 Reference Glossary, role boundaries, and verification notes

OPERATING RULE Overview cards summarize work. The linked project, tracker, review, travel, meeting, or ticket record remains the authoritative place to make and verify a change.

01 / START A SESSION

Confirm identity, review attention items, and enter through the correct module

Access: Open PULSE from the approved SharePoint page. PULSE uses the active SharePoint session and does not present a separate PULSE password screen.

Before acting: Confirm the name and role shown in the upper-right account area. Review Dashboard, My Work, meeting actions, and notification items before opening a record.

LOCAL FALLBACK The local browser fallback is intended for interface development only. It is not an official record and does not confirm SharePoint identity, permissions, or persistence.

Dashboard - quick access, personal work, meeting actions, and navigation

Dashboard controls

- PULSE mark: returns to Dashboard from another module.
- Primary navigation: opens Overview, Projects, Weekly Meeting, Travel, Document Review, and available administrative routes.
- Quick-access cards: open a module or a focused secondary action.
- My Work: shows work associated with the current user and available source records.
- Report issue: starts a support ticket when the route is available.
- Bell and account control: open notifications and Notification Settings.

02 / OVERVIEW

Use personal and team views to decide where action is required

Reach it: Select Overview. The available views organize personal work, portfolio context, operations queues, resources, and workload.

Use view and filter controls to narrow information, then open the linked project or record to make the change. Team-wide views and information outside the user's project access may be role-restricted.

Overview - personal and shared operational awareness

View or area	Use it to	Where to act
Personal work	Review assignments, current workload, and linked records associated with you.	Open the linked project, task, review, travel request, meeting, or ticket.
Portfolio context	Understand project condition, lifecycle, ownership, dates, and shared priorities.	Open the project workspace and update the source record.
Operations queue	Identify pending travel, review, support, or approval activity.	Open the relevant workflow record.
Resources and workload	Understand distribution of work and team participation.	Update assignments inside the project or tracker.

REMEMBER Overview is a decision surface, not a substitute for the underlying operational record.

03 / PROJECTS AND GROUPINGS

Find workspaces, organize related work, and maintain current project context

Reach it: Select Projects. Use the Projects, Portfolios, Programs, and End Item Configuration views to locate work at the correct level.

Authorized users can create a project and set its name, team, ownership, dates, purpose, and related organizational configuration.

Projects - project workspaces and organizational groupings

Project condition uses two different concepts

Field	Current values	Use
Lifecycle	Planned; Awaiting Funding; Active; Paused; Complete	Describes where the project is in its overall lifecycle.
Technical health	On Track; At Risk; Off Track	Describes the current technical condition and need for recovery attention.

KEEP SEPARATE Do not use lifecycle as a substitute for technical health. Keep both fields, owners, dates, and recovery context current.

04 / PROJECT WORKSPACE

The project is the front door to its people, files, work, meetings, reporting, and support

Open a project from Projects. Available tabs and controls can vary by project access and role. Confirm the project identity before editing.

01 Home

Project summary, condition, ownership, dates, and direct links.

02 People

Roster, roles, contractors, and key contacts.

03 Documents

Project-associated files and links. Not the formal review workflow.

04 Tracker and Gantt

Tasks, subtasks, owners, dates, health, notes, links, and schedule placement.

05 Boards

Configurable table or Kanban project work.

06 Reporting

Milestones, technical bullets, risks, timelines, photos, and PowerPoint output.

07 Meeting and Notes

Project-scoped meeting work and contextual notes.

08 Tickets and Settings

Project-linked support and authorized metadata maintenance.

RECORD OWNERSHIP Use the summary views to understand the project, but update the tracker, risk, review, travel, meeting, ticket, or configuration record that owns the information.

Maintain work with explicit owners, dates, condition, notes, and completion rules

Tracker

Use Tracker to create and maintain dividers, tasks, subtasks, owners, start dates, due dates, health, notes, and linked documents.

Task field	Current guidance
Workflow status	Not Started; In Progress; On Hold; Blocked; Complete
Timing	A past due date is a calculated timing condition, not another task status.
Blocked or on hold	Explain the dependency, reason, and next action before relying on the state.
Subtasks	Maintain their own assignee, dates, and related records when needed.

Gantt

Use the Gantt view to inspect or maintain schedule placement and dependencies. A bar reflects tracker dates. Confirm the underlying start and due dates whenever timing changes.

Boards

Boards can use table or Kanban presentation. A new board begins with To Do, In Progress, and Complete columns; authorized owners may configure its columns and fields. Board completion is defined by the final configured column.

CAUTION Do not move a visual bar or card without verifying the underlying work record and its dates, owner, and completion rule.

04.2 / REPORTING, MEETINGS, NOTES, TICKETS, AND SETTINGS

Convert project records into coordinated action without losing the source context

Reporting

Prepare milestones, technical bullets, risks, timelines, photos, and PowerPoint output. Check all source records before generating. A browser-generated file can download locally; when SharePoint mode is available, PULSE attempts project-file upload.

DRAFT OUTPUT Treat every generated presentation as a draft until its content, filename, and destination have been verified.

Meeting and Notes

Use Meeting for project-scoped facilitation and Notes for contextual project notes. Record a decision separately from general notes. Create a tracked action whenever a follow-up has an owner or timing expectation.

Tickets

Use project Tickets to create or review project-linked support items. Include the route, record identifier, expected result, actual result, and an approved screenshot when reporting an issue.

Settings

Maintain authorized project metadata, lifecycle, technical health, dates, reporting configuration, and related fields. A change becomes an official record only when SharePoint persistence succeeds.

05 / WEEKLY MEETING

Run the shared cadence and turn discussion into named records and actions

Reach it: Select Weekly Meeting. Use the available views to maintain the roster, agenda, Rocks, attendance, notes, decisions, project updates, action items, carry-forward work, and meeting history.

Weekly Meeting - shared cadence and meeting entry state

Operating sequence

- Start or join the correct shared or project-specific session.
- Confirm the roster, attendance, guests, and agenda before working through updates.
- Capture decisions as they occur and keep explanatory notes concise.
- Convert each actionable follow-up into a named tracker item with an owner and timing expectation.
- Review carry-forward work and meeting history before ending the session.

MEETING DISCIPLINE A note records context. A tracker item records accountable follow-up. Use both when an action results from the discussion.

Submit, monitor, approve, finance, and close travel through the related records

Reach it: Select Travel. Use New Request to enter the request type, trip title, travelers, destination, dates and times, purpose, impact, project, travel type, estimate, alternatives, and notes.

Travel - request entry, tracking, and role-aware workflow

Area	Guidance
Request status	Pending; Pending Finance; Approved; Denied; Revoked; Cancelled
Requester	Monitor your own record and respond to returned or updated requirements.
Approver or finance user	Use only the role-restricted action and record the required rationale or funding information.
Engineering travel	Complete additional fields when the selected request type exposes them.
Debrief	Each traveler records a separate debrief after travel.

POLICY BOUNDARY Application fields and routing do not replace organizational travel policy. Follow the approved policy source for submission timing, approvers, funding documentation, and debrief deadlines.

Maintain formal review, revision, concurrence, final-pack, and signing history

Reach it: Select Document Review. Create a review with its related project, document type, title, due date, revision label, current file, and reviewers or reviewer groups. Add signers only where sequential signing is required.

Document Review - formal review and approval workflow

Review value	Meaning in the current workflow
Not Started	The review record exists but review activity has not begun.
In Review	Assigned reviewers are evaluating the current revision.
Changes Requested	The current revision requires changes before review can continue.
Review Complete	The review stage is complete.

Complete revisions without losing the review and signature history

Review value	Meaning in the current workflow
Awaiting Final Pack	A final package must be prepared or uploaded.
Signing in Progress	Sequential or required signature activity is underway.
Signed	The configured signing process is complete.
Archived	The record is retained outside the active workflow.

Working sequence

- Confirm that the project, title, document type, due date, and current revision are correct.
- Assign the required reviewers or approved reviewer group.
- Record each decision against the current revision.
- When changes are requested, upload a new revision and repeat the required review.
- Prepare the final package before starting any configured signing sequence.
- Verify the signed or archived record and its retained revision history.

REVISION CONTROL When changes are requested, upload a new revision and repeat the required review. Do not overwrite the reviewed revision.

DISTINCT WORKFLOWS A file is not formally reviewed merely because it is stored in the project Documents area.

Create durable support records and configure how attention items reach you

Support Tickets

Reach it: Use Report issue, project Tickets, or an available ticket route. Record a clear title, description, affected project, priority, reporter, and status.

Ticket value	Use
Open	The issue has been recorded and still requires action.
In Progress	An assigned person is actively working the issue.
Resolved	The recorded issue has been addressed and the result can be verified.

Notifications

Use the bell to review items requiring attention. Notification Settings controls subscribed areas, delivery channels, and message tone where enabled. Adjust preferences for your own account only.

Notification Settings - personal delivery, area, and tone controls

VERIFY THE RECORD A notification is a routing aid. Always open the related record to confirm its current state and required action.

Maintain the approved schema, users, roles, configuration, and traceability controls

Reach it: Select Admin. Administrative routes and actions are intended for PULSE administrators and may not appear for other users.

Admin - access-aware entry state and maintenance routes

Administrative area	Operational guidance
Diagnostics	Use current diagnostics to identify environment, schema, or routing problems before changing configuration.
SharePoint Setup	Validate or provision the defined schema. Do not create ad hoc lists or columns.
Users and roles	Associate approved people, assign the least-privileged appropriate role, and preserve audit context when access changes.
Locations and configuration	Maintain approved reference values and related system settings.
Activity Log	Inspect recorded actions for operational tracing and investigations.

LEAST PRIVILEGE Project membership does not by itself grant PULSE administrative privileges. Assign only the access required for the user's current responsibilities.

Key terms, boundaries, and verification status

Term	Meaning
Portfolio	Named grouping of related projects.
Program	Higher-level initiative that can span portfolios.
End Item Configuration	Delivered hardware or software configuration used for grouping and reporting.
Tracker	Project work items, owners, dates, health, notes, and subtasks.
Board	Configurable project work presentation, separate from the tracker.
Project Documents	Project-associated files and references.
Document Review	Formal review and signature workflow with its own lifecycle.
PULSE role	Active role record that determines administrative and feature access.
Activity Log	Record of application activity used for operational traceability.

Verification status

The screenshots in this guide were captured from a clean local browser workspace using a neutral display identity and no seeded personal records. They verify visible routes and labels only.

LIVE VERIFICATION REQUIRED SharePoint identity, directory resolution, permissions, list and library operations, workflow persistence, exports, notifications, and administrator actions require validation on the approved live SharePoint site.

Area	Current evidence	Live site status
Shell, Dashboard, settings	Repository source and local route capture	Verify identity, data, and permissions
Overview and project groupings	Repository source and local route capture	Verify filters, create/edit, and access
Project workspace tools	Repository source	Verify populated records and persistence
Reporting and PowerPoint	Repository source and bundled export library	Verify generated file and SharePoint upload
Meetings, Travel, Review, Tickets	Repository source and route capture where available	Verify end-to-end workflow and notifications
Admin and SharePoint integration	Repository source and restricted route capture	Verify administrator actions on approved site

11 / OPERATING RULES

The shortest path to a clean, traceable PULSE record

01 Confirm context

Verify the user, role, project, record, revision, and current state before acting.

02 Use the source record

Update the project, tracker, review, travel, meeting, ticket, or configuration record that owns the information.

03 Name the owner

Every actionable follow-up needs a named owner and a timing expectation.

04 Preserve history

Create a new revision, status update, or audit-backed change rather than overwriting prior context.

05 Verify persistence

A change is official only after the approved SharePoint record reflects it.

06 Escalate with evidence

Use a support ticket with route, record ID, expected result, actual result, and an approved screenshot.

FINAL CHECK Before leaving a workflow, confirm the record state, owner, next action, notification or routing result, and any required audit or retained file.

PULSE

One shared view. Clear action.

Use the record that owns the work.
