

PULSE

One shared view. Clear action.

PULSE connects project execution, meetings, approvals, reporting, and leadership visibility in one secure operating workspace.

THE OPERATIONAL SHIFT

Replace fragmented work with one operating picture.

PULSE removes the gap between where work happens and where status is reported. The project becomes the front door, so tasks, people, files, meetings, approvals, and reporting stay connected in context.

WITHOUT PULSE

Status has to be assembled.

- Email threads become the approval system.
- Spreadsheets and lists drift out of sync.
- Meetings rely on manually prepared slides.
- Leadership sees lagging, self-reported status.

WITH PULSE

The operating picture stays current.

- Task data drives project health and completion.
- Every module resolves to the same people and projects.
- Approvals, notes, and actions remain traceable.
- Leadership reporting is generated from live work.

WHAT CHANGES FOR THE TEAM

01 Lead with current data

Executive rollups surface project health, completion, blockers, workload, and pending operations.

02 Run work in context

Each project connects its home page, roster, documents, tracker, boards, meeting, and reporting.

03 Move approvals end-to-end

Travel and document-review workflows keep decisions, revisions, notifications, and history together.

04 Report without rebuilding

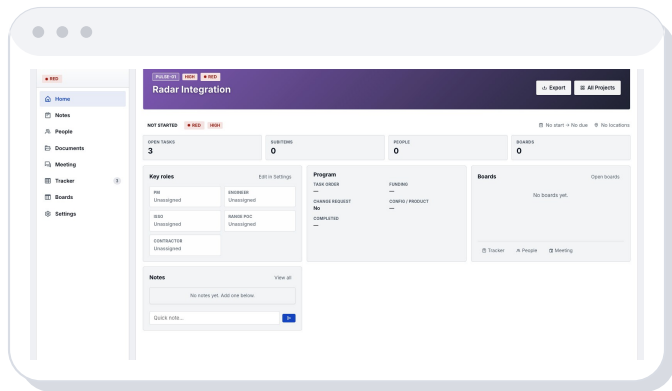

Project and group reporting turn current status into editable PowerPoint outputs from the browser.

ONE WORKSPACE, CONNECTED CAPABILITIES

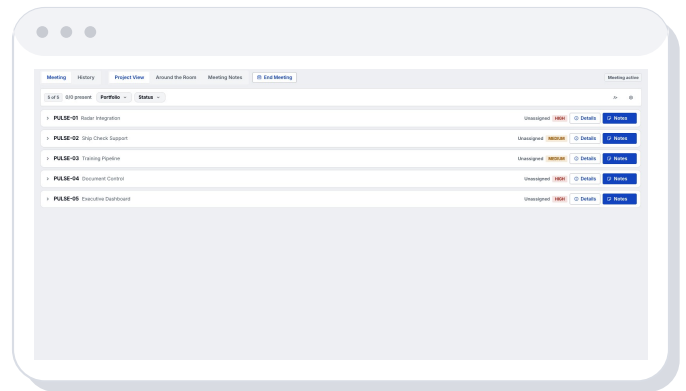

A complete operating system for the project team.

PULSE combines the functions teams use every day without turning them into isolated apps. The result is a faster path from work to decision.

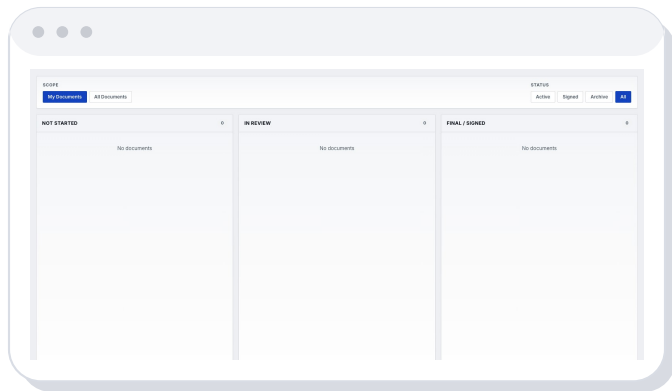

PROJECT WORKSPACE

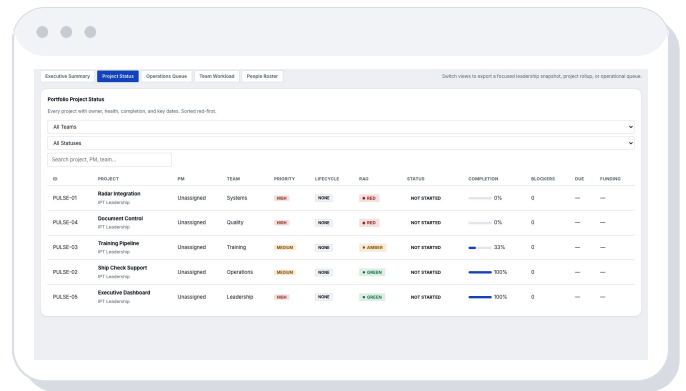

WEEKLY MEETING

DOCUMENT REVIEW

PORTFOLIO STATUS

Portfolio

Live health, completion, blockers

Projects

Tracker, Gantt, boards, files

Workflows

Travel, reviews, tickets

Reporting

Project and group PowerPoint

BUILT TO FIT THE ENVIRONMENT

Powerful enough to run the work. Lightweight enough to deploy.

PULSE runs inside the team's existing SharePoint environment. Users open it with their current SharePoint/CAC session, and the application uses SharePoint Lists and document libraries as its data layer.

● NO NEW LOGIN

Uses the user's existing SharePoint/CAC session.

● NO APP SERVER

Browser-only application; compute runs in the user's session.

● NO DATABASE SERVER

Structured data lives in SharePoint Lists; files stay in SharePoint.

● SECURITY FIT

Works inside the existing SharePoint access model and security boundary.

THE RESULT

Fewer handoffs. Faster status. Clear ownership. Better decisions.

P U L S E

From status to execution.

Give the team one place to run the work - and leadership one trusted view of what needs attention next.

Product claims and interface examples are based on the PULSE-IPT General Overview, User Guide, and Technical Reference, July 2026.
