

General Overview

A concise internal guide to what PULSE is, who it serves, how it fits into the operating environment, and where to go next.

BRAND PROMISE

See the work.
Understand the state.
Move the mission.

01 / ORIENTATION

One operating picture.

PULSE connects project delivery, updates, logistics, status, and execution so teams can identify the next action, its owner, and the supporting record without assembling the answer from disconnected tools.

OPERATING PREMISE

Information in. Coordinated action out.

The platform turns current operational inputs into visible ownership, decisions, and handoffs.

THIS DOCUMENT

Purpose	Orient readers before the detailed operating, technical, or procedural references.
Audience	Leadership, stakeholders, new team members, and anyone needing the current operating context.

01 Current ownership

Work is linked to the responsible person, project, timing, and supporting record.

02 Operational context

Tasks, files, meetings, travel, review activity, and reporting remain connected instead of becoming isolated records.

03 Actionable visibility

Role-aware controls, notifications, and activity history help teams move from awareness to coordinated execution.

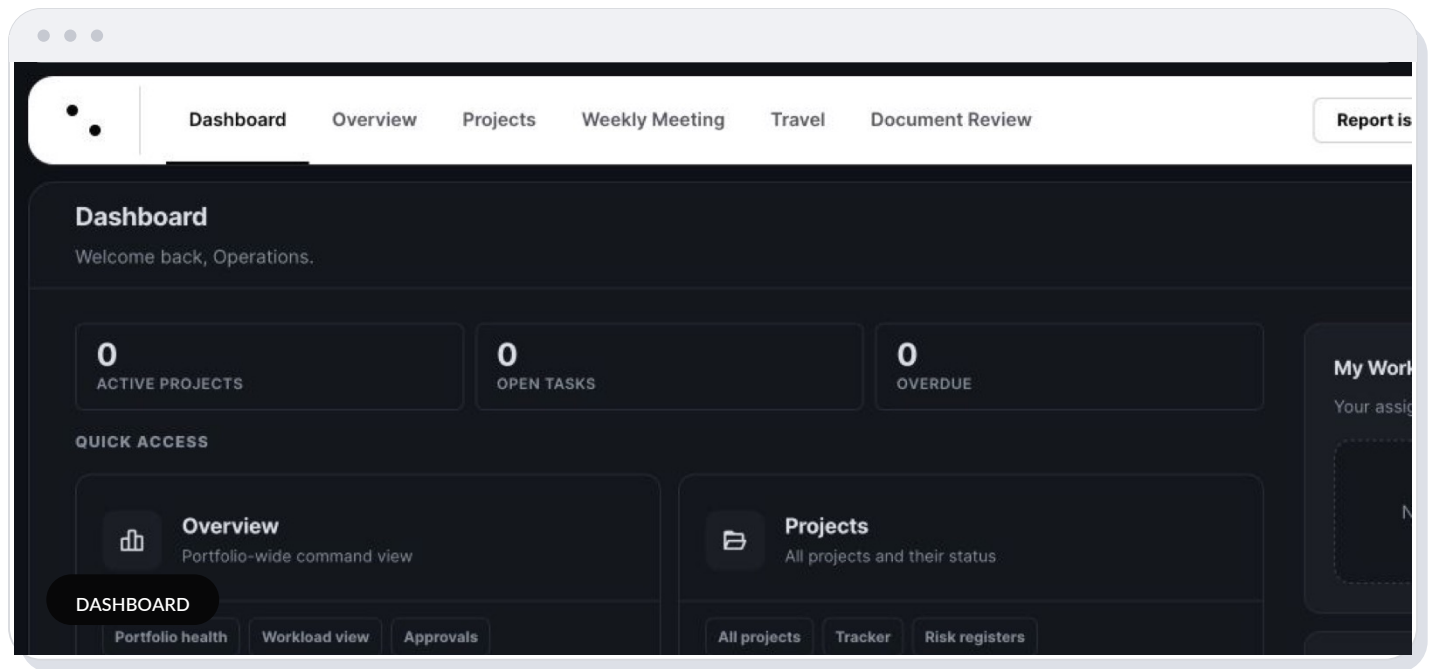

CORE INTERPRETATION

One shared view. Clear action.

The system should reduce ambiguity by making the current condition, responsible owner, and next action easier to identify.

A project-centered operations workspace.

PULSE is a SharePoint-hosted browser application that joins day-to-day execution around a shared navigation model and connected project records.

PROJECT AS THE FRONT DOOR

People, work items, files, meetings, notes, tickets, settings, and reporting are reached in the context of the project they support.

ONE NAVIGATION MODEL

Dashboard, Overview, Projects, Weekly Meeting, Travel, Document Review, preferences, and administration share a consistent structure.

ONE TRACEABLE PICTURE

Linked records, notifications, role-aware controls, and activity history make current conditions and next actions easier to find.

Built around the people who move the work.

PULSE supports the roles that create, coordinate, review, approve, and maintain operational records. Access is established through the existing SharePoint session and the active PULSE role record.

SHARED OPERATING RHYTHM

From work to decision.

Different users see different controls, but the underlying project, person, record, and history remain connected.

SEE THE WORK

UNDERSTAND THE STATE

MOVE THE MISSION

PL

Project leads

Coordinate ownership, schedule, project conditions, reporting, and handoffs.

DT

Delivery teams

Manage tasks, boards, project documents, notes, and day-to-day execution.

RV

Reviewers

Evaluate formal documents, decisions, revisions, concurrence, and signing activity.

TR

Travelers & approvers

Submit, route, approve, track, and debrief operational travel.

MT

Meeting participants

Run current work reviews, record notes, and maintain shared actions and objectives.

SA

Support & administrators

Manage tickets, users, configuration, diagnostics, SharePoint setup, and activity records.

PROJECT-CENTERED FLOW

PULSE GENERAL OVERVIEW

UNCLASSIFIED

VERSION 1.0 | JULY 2026 | 04

04 / CURRENT CAPABILITIES

Connected tools for the operating day.

The capability set spans personal awareness, project execution, formal workflows, reporting, meetings, and administration.

01 Dashboard & Overview

Personal and team-level situational awareness, workload, current assignments, operations queues, and quick access to major modules.

02 Project organization

Projects organized through project, portfolio, program, and End Item Configuration groupings.

03 Project workspaces

People, project documents, tracker, Gantt, boards, reporting, meetings, notes, tickets, and settings in one context.

04 Reporting

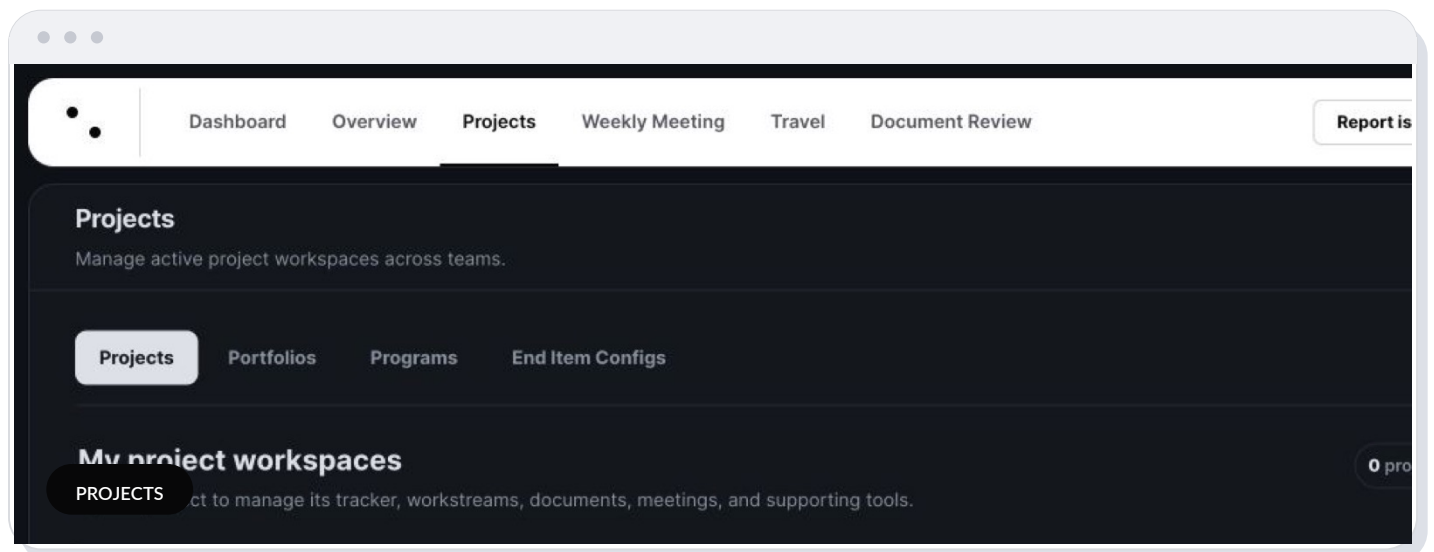

Project and group PowerPoint reporting generated in the browser, with SharePoint upload when running in SharePoint.

05 Operational workflows

Weekly Meeting, travel requests and debriefs, formal Document Review, support tickets, and notifications.

06 Administration & traceability

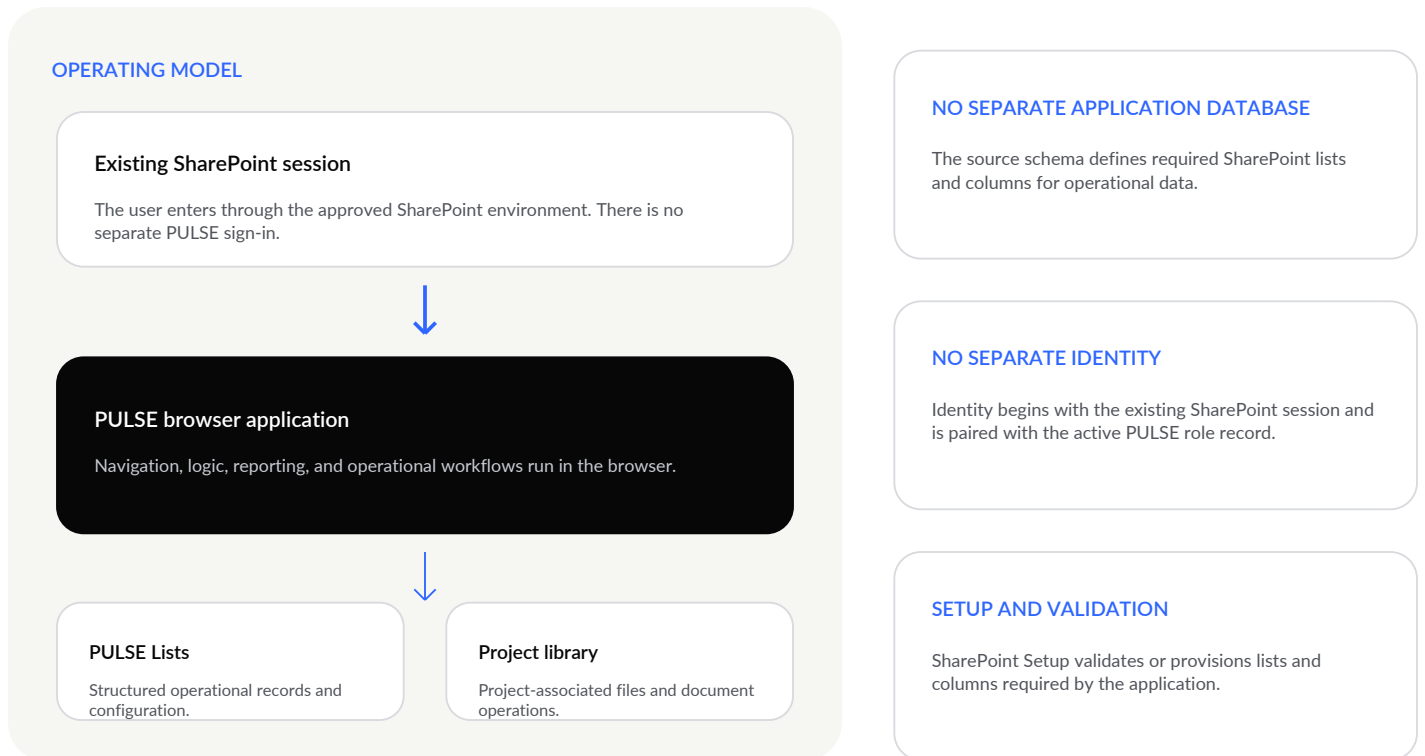

Users, configuration, diagnostics, SharePoint setup, role-aware controls, and activity records.

05 / SHAREPOINT FIT

Infrastructure-light by design.

PULSE is served from SharePoint, uses the existing SharePoint session for identity, and connects to PULSE Lists and project document-library operations through same-site REST calls.

A CRITICAL DISTINCTION

Project Documents

Project-associated document-library files and references used in the project workspace. Storage here does not prove formal review completion.

Document Review

A separate formal workflow that records reviewers, revisions, approvals, final-pack handling, signatures, and workflow state.

From scattered records to coordinated execution.

A loose collection of lists can store information. PULSE preserves the relationships that make the information usable during the operating day.

OPERATING NEED	DISCONNECTED APPROACH	PULSE APPROACH
Find current ownership	Search email, trackers, meeting notes, and individual lists.	Link the person, project, work item, timing, and supporting record.
Understand current conditions	Reconcile separately maintained status, schedule, and review information.	Use connected project, workload, workflow, and activity views.
Move a workflow forward	Rely on manual routing and follow-up across separate tools.	Use current-state routing, role-aware controls, notifications, and linked records.
Prepare leadership reporting	Rebuild a briefing from spreadsheets, notes, and screenshots.	Generate project and group PowerPoint reporting from the operating record.
Reconstruct what happened	Piece together changes from messages and local copies.	Use consistent labels, related records, and activity logging.

CONNECTED CONTEXT

PULSE preserves the relationship between a project, its people, work items, risks, files, meetings, travel, review activity, and reporting.

OPERATIONAL DISCIPLINE

Consistent labels and visible state reduce ambiguity. Role-aware controls and notifications make the next action easier to identify.

PRIMARY TAGLINE

One shared view. Clear action.

The identity frames the operating picture without competing with it.

[07 / READ NEXT](#)

Move from orientation to action.

This overview establishes the operating context. Use the companion document that matches the work you need to perform next.

01**User Guide**

Navigation, screen-by-screen explanation, role-aware controls, and day-to-day operating instructions.

02**Technical Reference**

Source structure, configuration, SharePoint integration, packaging, deployment, maintenance, and troubleshooting.

03**Standard Operating Procedures**

Repeatable workflows, prerequisites, expected results, verification, records, and escalation guidance.

04**Source Audit**

Verified boundaries, deliberate exclusions, and the items that still require authorized live-site confirmation.

BRAND IN ONE SENTENCE

A calm, precise system that turns
current information into coordinated execution.

P U L S E

Capability descriptions reflect the supplied source package and local role captures. Production hosting, live SharePoint permissions, write behavior, and role assignments require confirmation in an authorized site session.
