Documentation Verification & Governance

A controlled internal appendix that records what the current source package supports, what the local capture demonstrates, and what still requires an authorized SharePoint session or organizational decision.

DOCUMENT TYPE	STATUS	VERSION
Verification appendix	Internal working reference	July 2026

01 / PURPOSE

What this appendix controls

This document keeps the polished documentation set honest. It separates repository-supported behavior, locally visible interface evidence, live SharePoint verification, and unresolved organizational policy.

VERIFIED SOURCE

What the package can state now

The active browser source, current route labels, current schema file, and supplied brand guidance were reviewed and used as the basis of the documentation set.

VERIFICATION BOUNDARY

What the package cannot prove locally

Live SharePoint permissions, transaction persistence, production deployment authority, and records policy require an approved operational environment or an authoritative policy source.

13

FEATURE AREAS TRACKED

9

PROCEDURE GROUPS TRACKED

8

CURRENT UI CAPTURES

7

POLICY QUESTIONS OPEN

INTERPRETATION RULE

A locally visible route proves that the interface exists. It does not prove that the route can complete a SharePoint transaction, enforce the intended permission, send a notification, or satisfy records policy.

01

Source support

Code, schema, current module order, and visible labels.

02

Operational proof

Authorized create, update, refresh, approval, export, and audit evidence.

03

Policy authority

Retention, classification, approval rights, release authority, and escalation rules.

02 / SOURCE HIERARCHY

Evidence is ranked by authority

The current package uses the active implementation and current application labels first. Historical references are retained only when they remain consistent with the current source.

- 1 **Active implementation.** The SharePoint Framework web part renders LegacyWorkspaceFrame, which embeds the generated browser application sourced from apps/PULSE.
- 2 **Current browser source.** apps/PULSE/index.html defines the active module order and current visible interface labels.
- 3 **Current schema.** apps/PULSE/assets/js/sharepoint-schema.js is the current source schema referenced by the package.
- 4 **Local route capture.** The clean local browser instance verifies visible routes, labels, and empty-state behavior.
- 5 **Brand guide.** Logo use, color vocabulary, typography, and voice follow the supplied PULSE identity system.
- 6 **Historical documents.** Older naming and superseded status descriptions are excluded when they conflict with the current implementation.

INCLUDED IN THE CURRENT DOCUMENTATION

PULSE naming, current visible lifecycle and health terminology, current routes, current schema references, and browser-local limitations.

DELIBERATELY EXCLUDED

Legacy product naming, superseded color-coded project descriptions, and any suggestion that browser-local fallback is an authoritative operational record.

CORE BOUNDARY

Source-supported is not the same as operationally approved.

The documentation can describe supported behavior. Release authority, production permissions, data handling, retention, and classification remain outside the evidence available in the local source package.

03 / FEATURE MATRIX

Interface and source support

The first matrix records what is supported by the repository and what was visible in the clean local application.

FEATURE AREA	SOURCE EVIDENCE	LOCAL EVIDENCE
Shell, Dashboard, notifications, account settings	app.js, dashboard.js, notification-settings.js	CAPTURED
Overview and workload views	pages/overview.js, pages/workload.js	Overview captured
Projects, portfolios, programs, end-item configurations	pages/projects.js and repository mapper	Projects route captured
Project People and Documents	pages/people.js, pages/project-documents.js	Not populated
Tracker, Gantt, Notes, risks, settings	pages/projects.js, data.js	Not populated
Boards	pages/checklists.js and board mapper	Not populated
Reporting and PowerPoint output	Export modules and bundled PptxGenJS	Source reviewed
Weekly and project meetings	pages/weekly.js	Weekly route captured
Travel and debriefs	pages/travel.js	Travel route captured
Formal Document Review	pages/docreview.js	Review route captured
Tickets	pages/tickets.js, issue-reporting.js	Source reviewed
Admin, users, roles, locations, logs, setup	Admin, users, logs, schema, and adapter modules	Restricted entry captured
REST and role resolution	Adapter, repository, and schema modules	Not applicable locally

MEANING OF CAPTURED

Captured means the local route and its visible labels were observed. It does not mean that a live record was written to SharePoint.

04 / OPERATIONAL EVIDENCE

What still requires an authorized site

Every major workflow has a clear live-verification requirement. These checks should be completed on an approved SharePoint site using representative, non-sensitive records.

FEATURE AREA	REQUIRED OPERATIONAL EVIDENCE
Shell and account surfaces	Current identity, notification state, account settings, and role-aware navigation.
Overview and workload	Correct rollups from live project, task, travel, and review records.
Projects and organizational groupings	Create, edit, filter, assign access, refresh, and confirm persistence.
People and Documents	Directory resolution, document-library access, uploads, links, and permissions.
Tracker, Gantt, Boards, Notes, risks, settings	Create and update records, reload, and confirm data remains consistent.
Reporting	Generate PowerPoint, inspect output, confirm destination and access, and verify SharePoint upload when enabled.
Meetings	Start and save a session, retain notes, link action items, and retrieve history.
Travel and debriefs	Submit, approve or deny with the correct role, complete finance actions, and file a debrief.
Document Review	Upload revision, assign reviewers, record decisions, complete signing, and test archive behavior.
Tickets and notifications	Submit and update a ticket, verify preference persistence, routing, and delivery.
Admin and setup	Perform authorized configuration, schema setup, user/role maintenance, and audit-log review.
REST and role resolution	Confirm writes, permissions, identity mapping, and error handling on the approved site.

EVIDENCE TO RETAIN

Record ID, action time, role used, before and after state, notification evidence, audit entry, output file, and result after refresh.

DO NOT INFER

A successful local render cannot prove permissions, persistence, notification delivery, retention, classification, or approval authority.

05 / PROCEDURE MATRIX

Evidence required before operational use

The SOP describes the intended workflow. This matrix records the minimum evidence needed before a procedure should be treated as operationally validated.

PROCEDURE GROUP	SOURCE-SUPPORTED BASIS	EVIDENCE REQUIRED
Project and tracker maintenance	Project, action-item, risk, settings UI, and repository mapping	Live create, update, refresh, and activity evidence
Gantt and boards	Tracker/Gantt and board modules	Task scheduling and board persistence
Reporting and PowerPoint	Browser export modules	Output review, upload destination, and access confirmation
Weekly and project meetings	Meeting module	Session save, action-item linkage, and history retrieval
Travel and debriefs	Travel module and schema	Request, role-restricted decision, finance, and debrief transaction
Formal Document Review	Review module and schema	Revision, decision, signing, and archive workflow
Tickets and notifications	Ticket and notification modules	Ticket updates and preference persistence
Users, roles, setup, and logs	Admin, users, schema, adapter, and audit modules	Administrator operation on approved site
Export and troubleshooting	Build and diagnostics code	Hosted release, rollback, and retained evidence

VERIFICATION STANDARD

A procedure is validated only when the full transaction survives refresh.

For role-restricted workflows, validation also requires the correct role boundary, downstream notification or queue state, and the expected audit record.

01

Perform

Complete the action with the intended role.

02

Refresh

Reload and confirm the state persisted.

03

Trace

Confirm notification, queue, output, and audit evidence.

06 / GOVERNANCE DECISIONS

Seven decisions remain outside the code

These questions require an authoritative organizational answer. The application and repository cannot establish policy by themselves.

01 Deployment authority

Which office authorizes production deployment and rollback of a PULSE package?

02 Records retention

What retention periods apply to project, meeting, travel, formal review, ticket, notification, and activity records?

03 Classification and handling

Which markings, handling restrictions, and approved storage locations apply to each record type and generated PowerPoint file?

04 Travel evidence

What evidence is required for travel approval, finance approval, denial, revocation, and cancellation?

05 Role authority

Which roles may create, edit, archive, restore, export, or delete each record type?

06 AI grammar review

Is the capability approved, and if so, what endpoint, identity mechanism, data-handling rule, and model are authorized?

07 Change control and escalation

What is the approved peer-review, release-validation, incident-response, and escalation process?

POLICY BOUNDARY

Until an authoritative answer is recorded, these items should remain explicitly marked as open and should not be presented as enforced system behavior.

07 / CAPTURE SET

Current interface evidence

All eight captures were made on July 25, 2026 from a clean local browser instance at 1600 x 1172 pixels. The neutral display name was Operations Lead, with empty local storage and no personal email addresses or seeded records.

CAPTURE BOUNDARY

These images verify visible routes, labels, and empty-state behavior. They do not prove SharePoint writes, permission enforcement, or workflow completion.

07 / CAPTURE SET CONTINUED

Workflow and administration surfaces

The second capture page records the remaining workflow and access-aware entry surfaces from the same clean local browser instance.

Travel

Member / empty local

Document Review

Member / empty local

Notification Settings

Member / empty local

Admin

Access-aware entry

DATA HYGIENE

No personal email addresses or seeded records were present in the capture instance.

EVIDENCE LIMITATION

The Admin capture is an access-aware entry state, not proof of administrator-only operations.

08 / RECOMMENDED SEQUENCE

Close the evidence gaps in controlled passes

The sequence below is a structured recommendation derived from the open verification items. It does not replace organizational change-control or test policy.

PASS 01

Identity and access

- ☐ Confirm user resolution
- ☐ Confirm role-aware navigation
- ☐ Confirm list and library permissions
- ☐ Confirm admin recovery path

PASS 02

Core records

- ☐ Create and update a project
- ☐ Create tasks, notes, risks, and boards
- ☐ Refresh and confirm persistence
- ☐ Review audit entries

PASS 03

Operational workflows

- ☐ Save a meeting and actions
- ☐ Complete travel stages
- ☐ Complete review and signing
- ☐ Submit and close a ticket

PASS 04

Outputs and delivery

- ☐ Generate PowerPoint output
- ☐ Confirm upload destination and access
- ☐ Verify email or Teams delivery
- ☐ Test preferences and deep links

PASS 05

Release and recovery

- ☐ Deploy approved package
- ☐ Retain build and release evidence
- ☐ Test rollback to known-good package
- ☐ Record incident and escalation route

EXIT CRITERIA

Evidence complete

- ☐ Expected state survives refresh
- ☐ Role boundary is correct
- ☐ Notification or output is retained
- ☐ Audit record matches the action

09 / CLOSEOUT

Document the decision, not just the test

Once live verification and policy decisions are complete, the evidence should be linked to the relevant feature and procedure matrices and retained with the approved documentation release.

RELEASE READINESS

One shared view. Clear evidence.

Operational acceptance should show who tested the behavior, which role and environment were used, what changed, what persisted after refresh, which notification or output was produced, and where the audit evidence is retained.

Verification record

- ☐ Feature or procedure
- ☐ Environment and version
- ☐ Tester and role
- ☐ Test record identifiers
- ☐ Expected and actual result
- ☐ Evidence location

Approval record

- ☐ Policy owner
- ☐ Release authority
- ☐ Approved storage location
- ☐ Retention requirement
- ☐ Classification or handling rule
- ☐ Approval date and review cycle

MAINTENANCE RULE

Update this appendix whenever the application route, schema, role model, deployment method, workflow behavior, or governing policy changes.

Technical verification lead / date

Operational or policy authority / date
