

VISUAL REFERENCE

Interface Reference

Eighteen captures of the shipping build, grouped the way the application is navigated. Use these to confirm that a written step matches what a user actually sees.

NOTE

Every record shown is synthetic. These captures confirm routes, labels, and rendered state only — they are not evidence of a completed SharePoint transaction, of administrator-only control, or of notification delivery.

CAPTURES	IDENTITY	DATA	CAPTURED
18 routes	Neutral role names	Synthetic, example.mil	July 2026

USING THESE CAPTURES

06 / HOW TO USE THIS REFERENCE

These captures exist so a procedure can be checked against the product. When a written step and a screen disagree, the screen is the fact and the step needs correcting — or the application has changed and the capture set is stale.

WHEN TO REGENERATE

- A route, tab, or label changes.
- A status vocabulary changes, since the captures show live values.
- A new area ships that a reader would look for here.

Serve the application locally, run the capture script, and rebuild this document. The script exits non-zero if a route's expected selector never appears, so a blank capture is not written as a success.

CAUTION

Do not capture against a site holding real records. The capture identity and every seeded record must remain synthetic, because these figures are published in a document that circulates.

RELATED MATERIAL

- Internal User Guide, for the procedure each screen supports.
- Document 12, Process Flows, for how records move between the states these screens display.
- Screenshot Manifest in the documentation source, for the per-file capture record.
