

HOW WORK MOVES

Process Flows

Four sequences that answer most of what people ask: what happens to a travel request, how a document reaches signature, where a ticket goes, and how a hosted tool finds its SharePoint site.

NOTE

A diagram shows the route, not the rules. Who may move a record between these states, and what evidence each move requires, is in the Standard Operating Procedures.

FLows

Four sequences

STATes

As the app displays them

EXCEPTIONs

Shown, not hidden

AUTHORITY

SOPs, not this document

READING THESE DIAGRAMS

01 / HOW TO READ A FLOW

Each diagram runs from the entry point to the closed state. States and labels are the values the application actually displays, so a diagram can be checked against a record rather than trusted.

SHOWN AS	MEANS
Blue outline	Entry point — where the record is created
Plain outline	In progress — the record is being worked
Green outline	Closed with an outcome recorded
Dashed outline	Exception — the record left the normal route
Solid arrow	The normal progression
Dashed arrow	An exception or a loop back for rework

IMPORTANT

A state on a diagram is not a permission. Reaching a state says nothing about who was entitled to move the record there; role boundaries are defined in the procedures and enforced by the application.

TRAVEL

02 / TRAVEL REQUEST

A request moves through approval and funding before travel, and is not closed until every traveller has filed a debrief.

Source: Travel request status values and the travel module

WHAT CLOSES A TRIP

Approval is not the end of the record. A trip stays flagged in My Travel until every traveller has filed a debrief, which is why the closed state here is the debrief rather than the approval.

REVIEW

03 / DOCUMENT REVIEW

Formal review is a controlled loop: requested changes produce a new revision and the review runs again. Storing a file under a project is not review.

Source: Document Review workflow values

WHY THE LOOP MATTERS

Requested changes produce a new revision and the review runs again; the reviewed revision is never overwritten. A file stored under a project has not been through this loop and is not review evidence.

SUPPORT

04 / SUPPORT TICKET

Tickets and issue reports are the same records in the PULSE Issues list, so a ticket raised in the standalone tool is the one the full application shows.

Source: Ticket status values and the repository mapping

ONE RECORD, TWO DOORS

Tickets and issue reports are the same records in the PULSE Issues list. A ticket raised in the standalone Tickets package is the one the full application shows, so the same problem must not be opened twice.

HOSTING

05 / SITE RESOLUTION IN A WEB PART

A focused tool in a SharePoint iframe cannot see the page context directly. It tries six sources in order, and local-only mode is the deliberate signal that none succeeded.
